

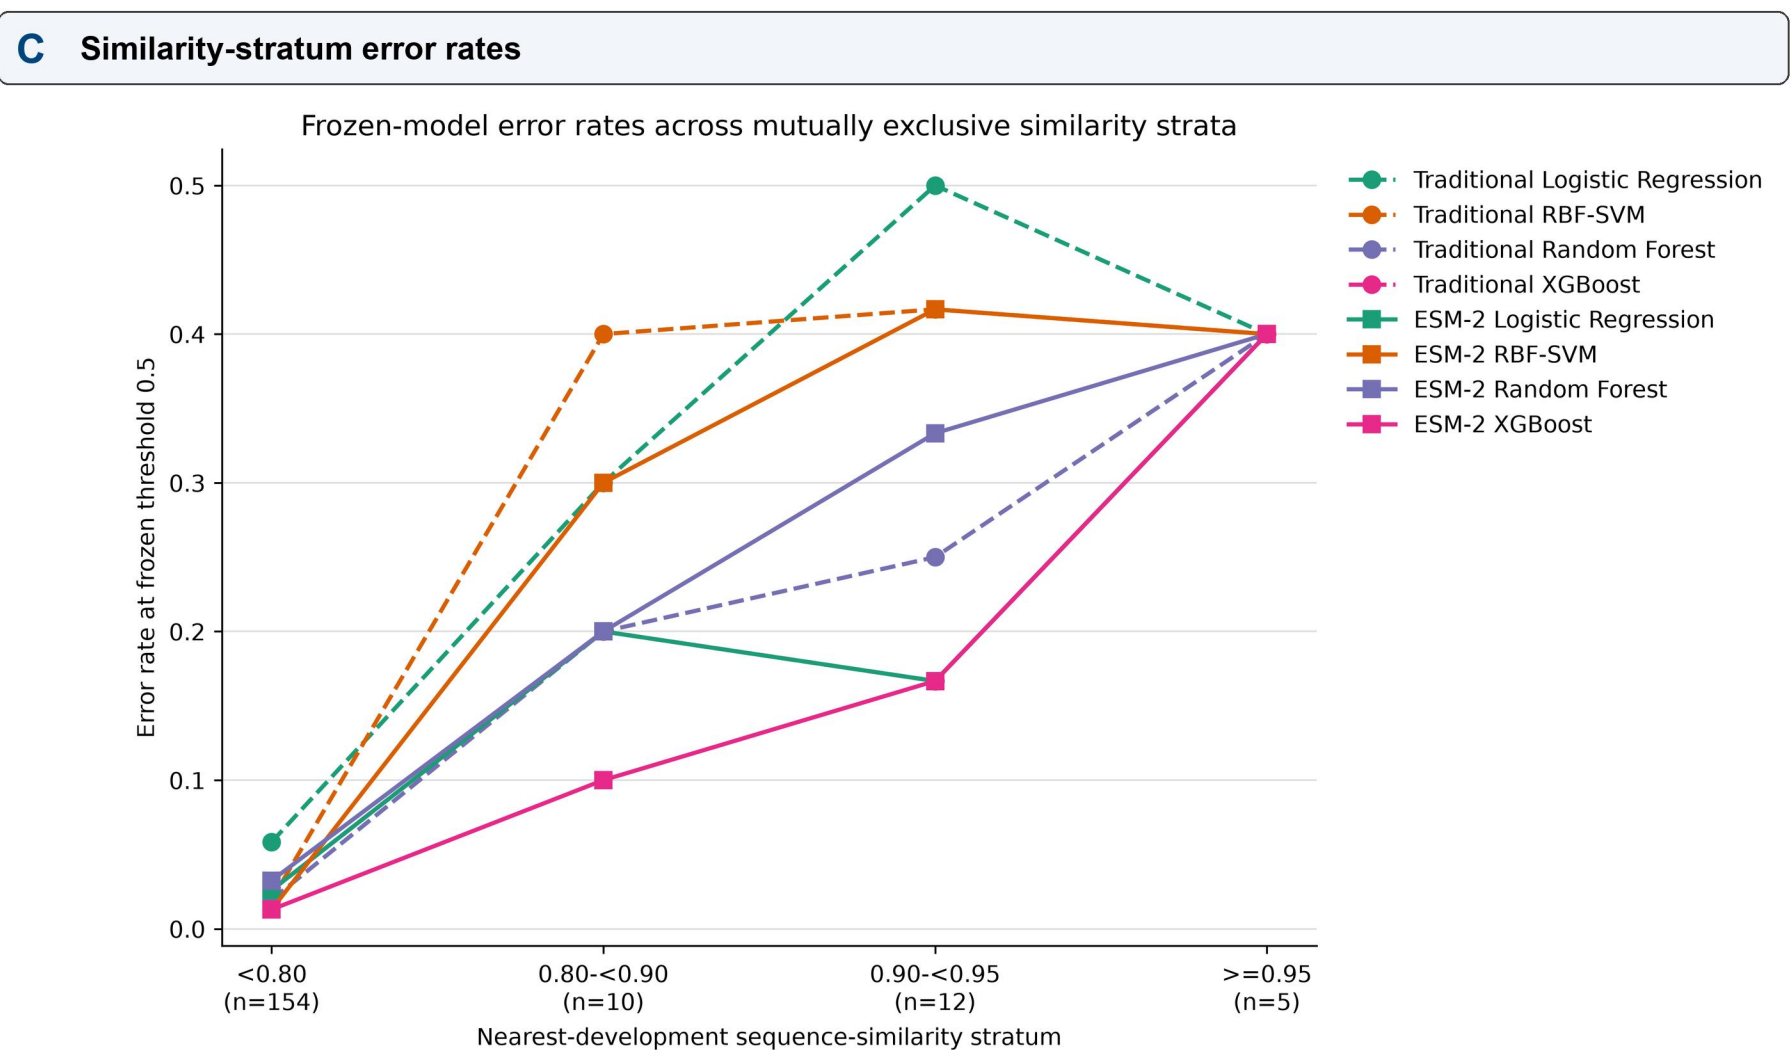

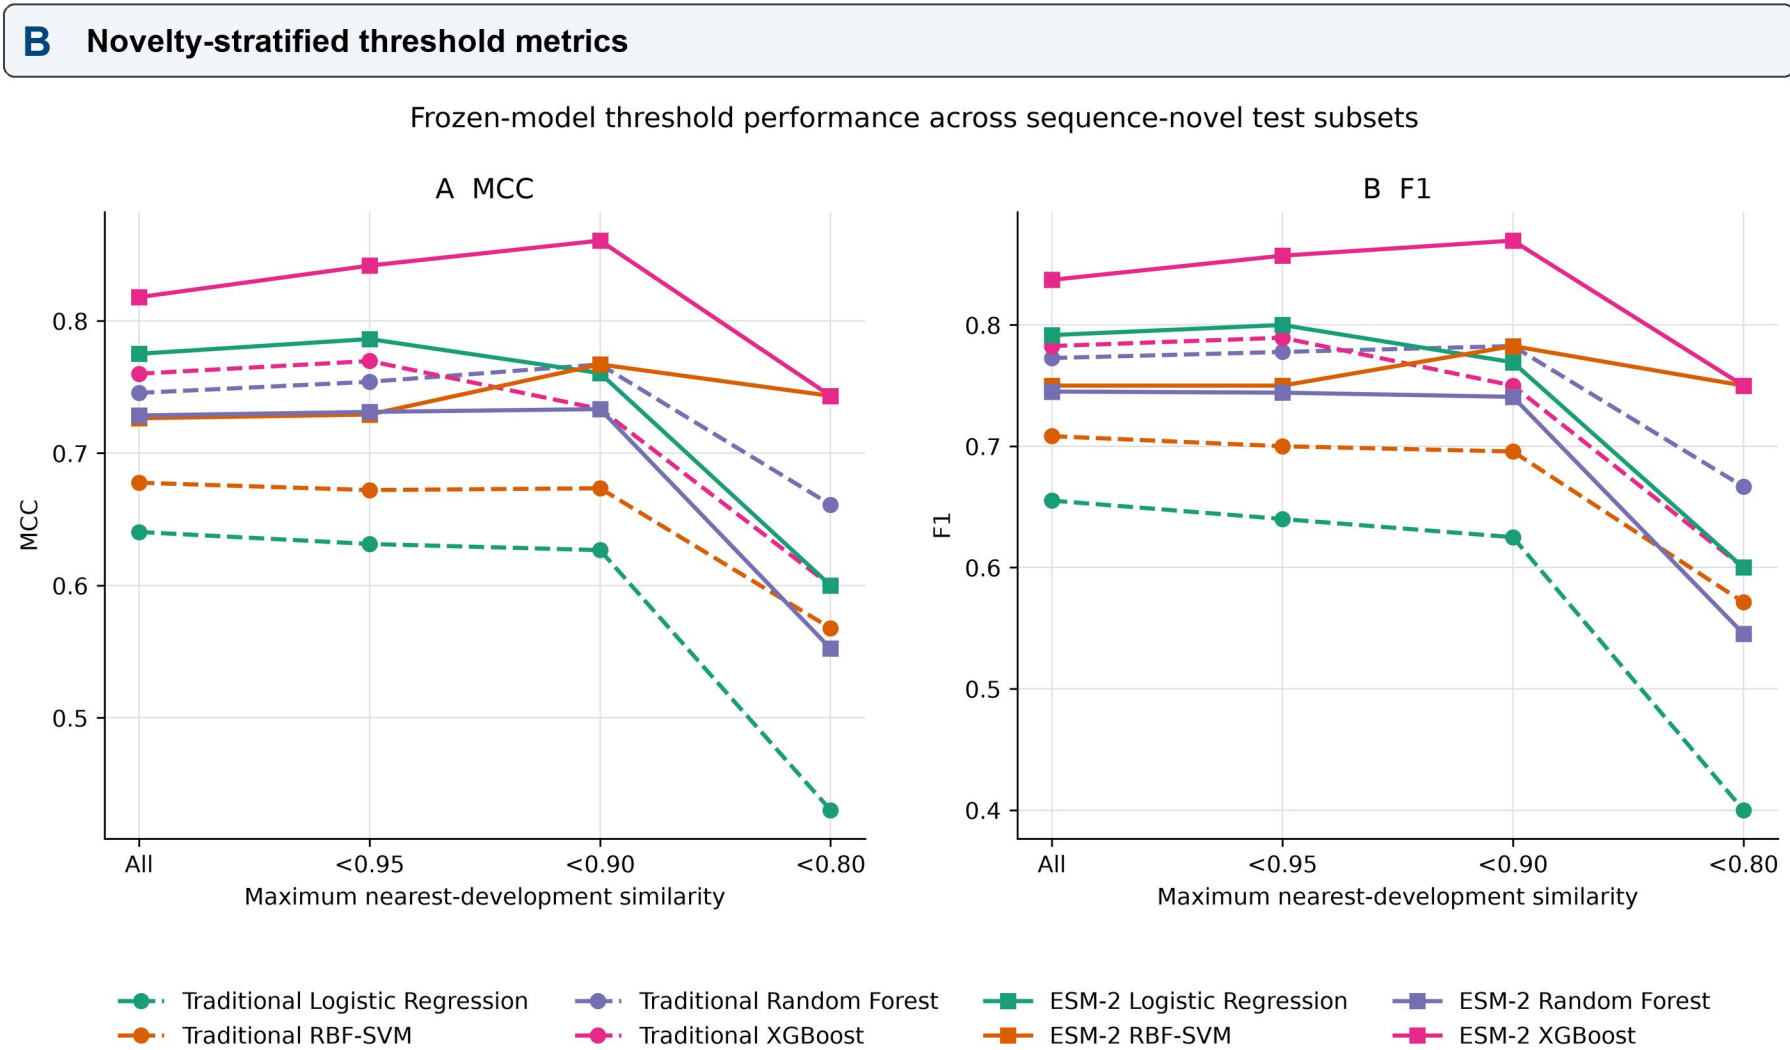

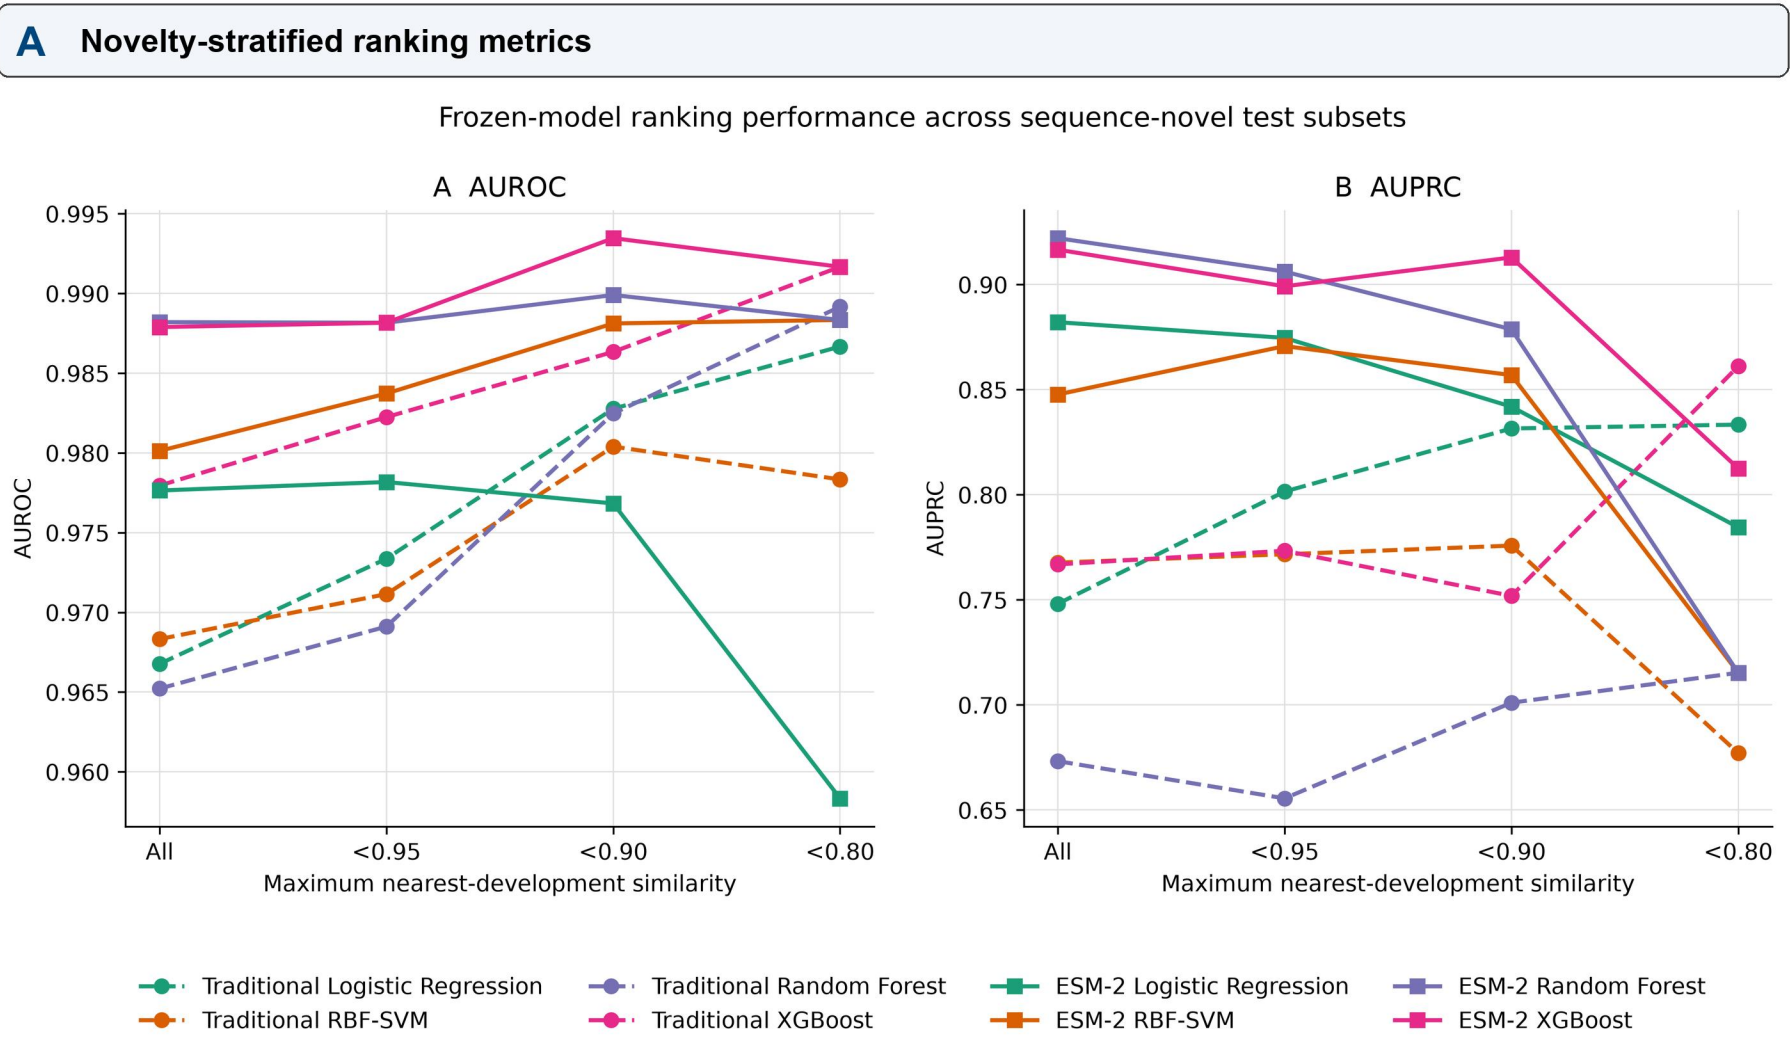

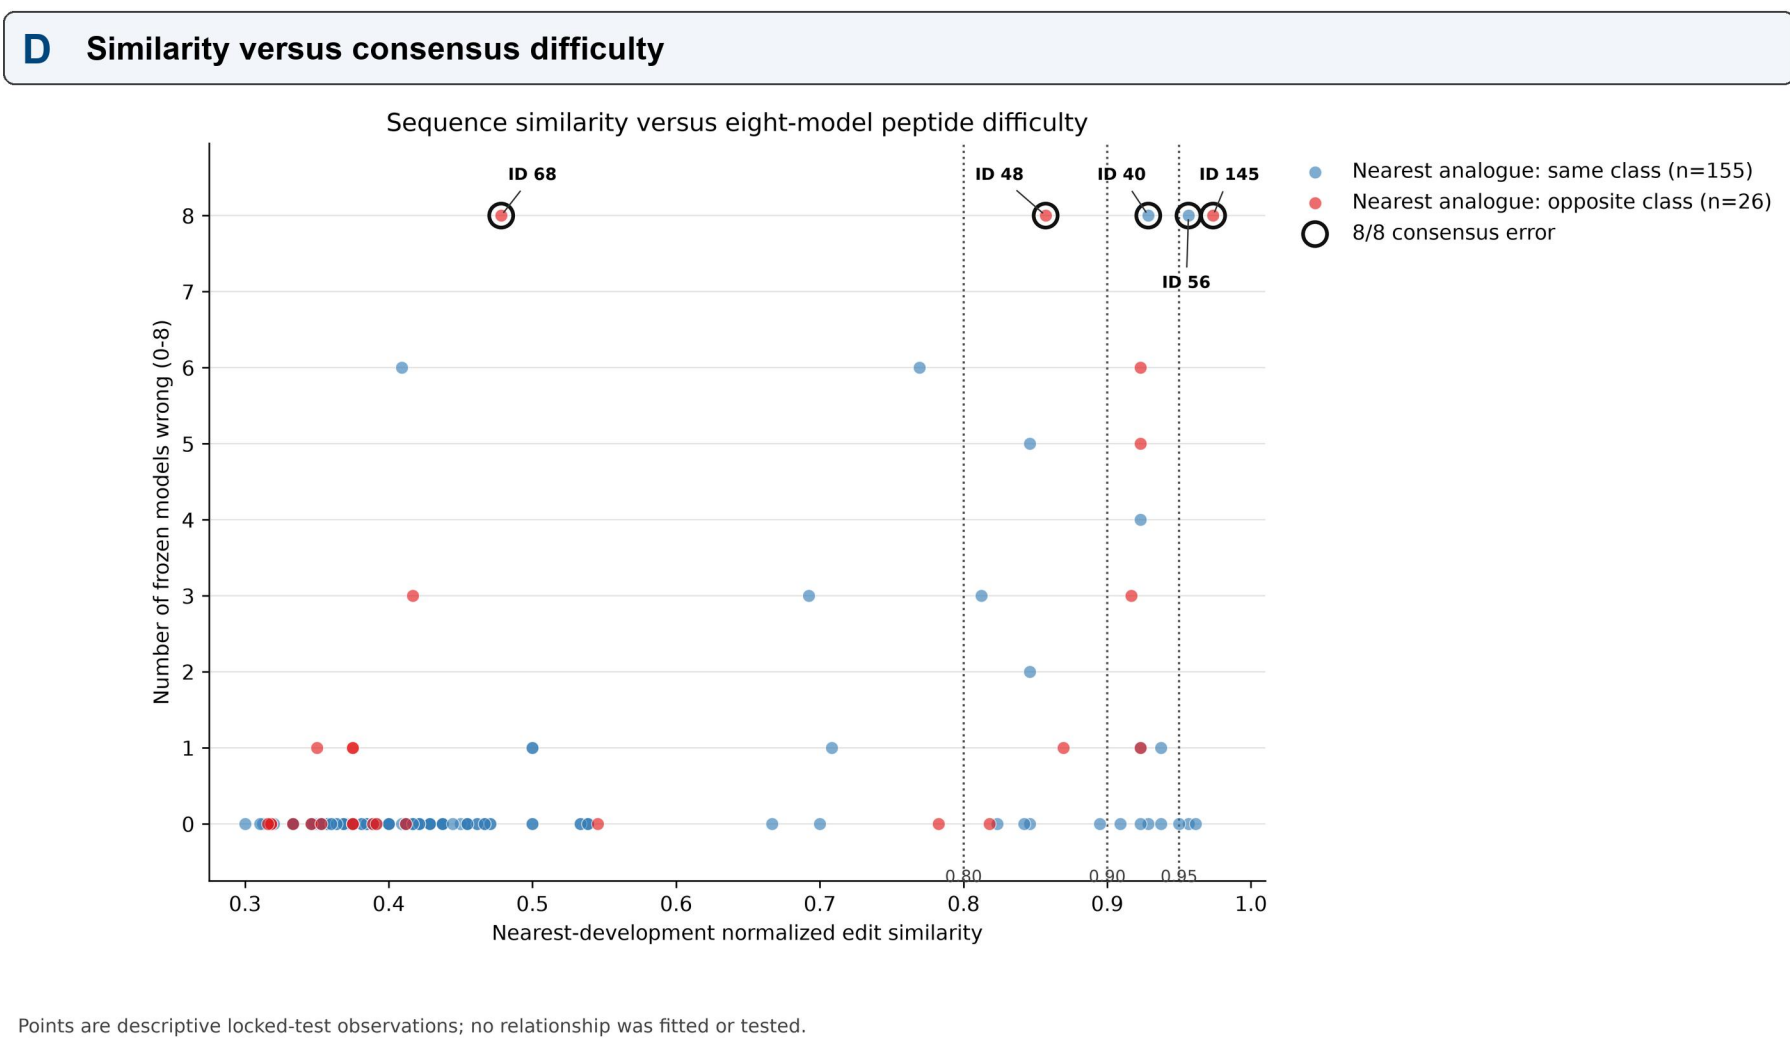

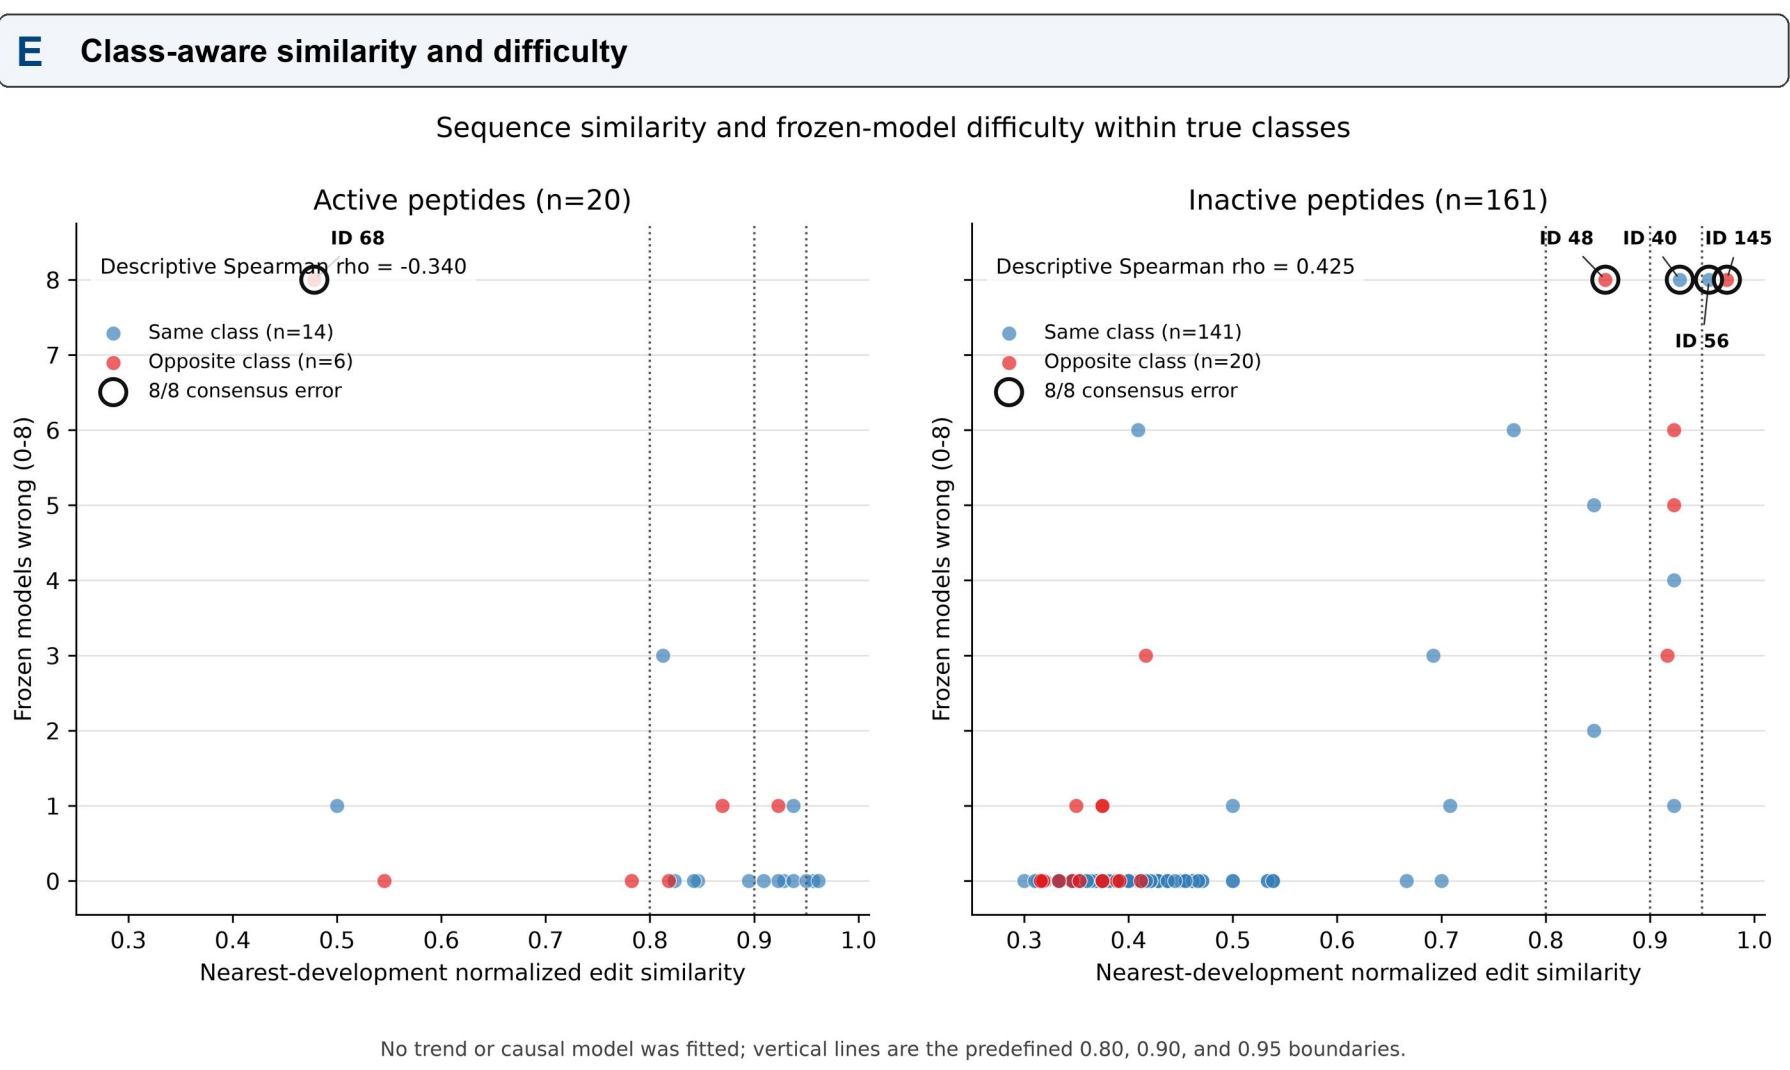

Figure 4. Sequence novelty and homology-aware generalization

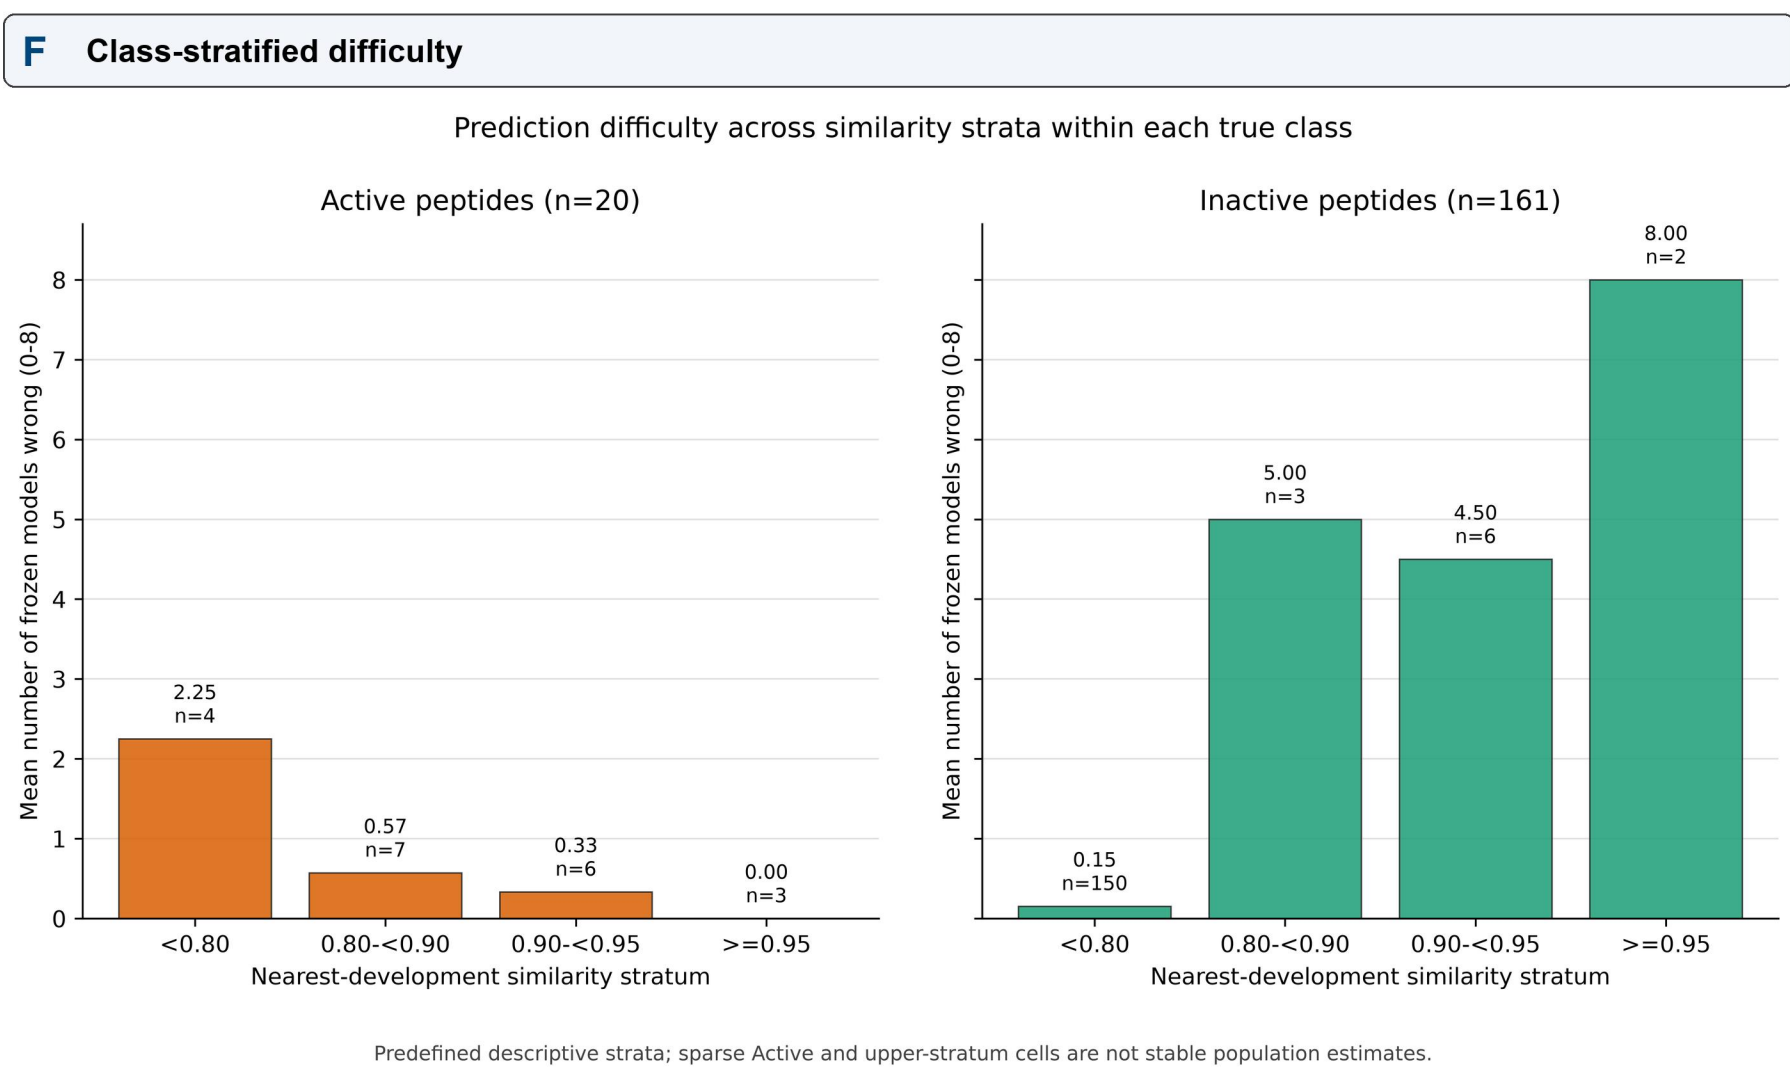

Descriptive only; upper strata contain 10, 12, and 5 peptides.

Points are descriptive locked-test observations; no relationship was fitted or tested.

No trend or causal model was fitted; vertical lines are the predefined 0.80, 0.90, and 0.95 boundaries.

Predefined descriptive strata; sparse Active and upper-stratum cells are not stable population estimates.
